Empathy Map Canvas:

Overview

This Empathy Map captures the qualitative experiences, attitudes, and friction points of the primary customer persona (**Enterprise Network Requester**) within the **Automated Network Request Management** project in ServiceNow.

Section-by-Section Breakdown

1. Think & Feel (Internal Monologue)

- **What really counts:** Getting network access (VPN, Firewall rules, VLAN allocation) approved and configured quickly to hit project deadlines.
- **Preoccupations & Worries:**
 - "Is my request sitting unread in someone's inbox?"
 - "Did I enter the wrong target IP address or subnet mask on the form?"
 - "Will network security delays cause my project to miss its launch date?"

2. Hear (Environmental Influences)

- **What colleagues and managers say:**
 - "Network security approvals are always a major process bottleneck."
 - "You need to send an email to IT support if you want a status update."
 - "Make sure you get manager approval first or the ticket will be ignored."

3. See (Observed Environment)

- Static catalog forms lacking dynamic field validation.
- Opaque ticket processing with no visual status bar on the portal.
- Disjointed email chains required to clarify missing technical parameters.

4. Say & Do (Observed Behavior)

- Sends manual daily follow-up emails to IT support and network engineers.
- Guesses technical parameters on unvalidated static forms.

- Escalates tickets directly to management to bypass delay queues.

5. Pain (Frustrations & Obstacles)

- **Fears & Obstacles:** Zero real-time visibility into approval status or assigned network teams.
- **Frustrations:** Incomplete submissions cause tickets to bounce back via email chains.

6. Gain (Needs & Success Measures)

- **Wants & Needs:** A single Service Portal form with dynamic IPv4 validation and automated Flow Designer approval routing.
- **Measures of Success:** Predictable fulfillment within 8–24 hours enforced by automated SLAs.
